

HEART OF GOLD LITEPAPER

In the past couple of years, we've seen an unprecedented rise in the popularity of cryptocurrencies which was fueled by the introduction of NFTs - one of which is Heart of Gold (HoG)

INTRODUCTION TO HEART OF GOLD

Heart of Gold is a massive NFT project that looks to be more than simple JPEGs. The collection consists of 10,000 unique NFTs that are also lottery tickets that always result in the player winning. The project is built on win-win gaming mechanics and is designed in a way that everyone who mints an NFT can win.

What's more, players get the chance to win up to 100X for every ticket. All the game's mechanics are completely transparent and made to be sustainable, which is the downfall of many other NFT projects.

WHAT IS HEART OF GOLD?

Heart of Gold is a massive NFT collection. Each NFT is unique and serves as a lottery ticket. Buyers can then choose to trade in their lottery ticket to Deus Ex Machina, a mysterious entity that needs the tickets to sustain itself. When you do this, you get sure returns up to 100X the initial price of minting the NFT.

Players can also opt to sell the NFTs on the secondary market or hold on to their tickets until the grand lottery, which Heart of Gold plans to release down the line.

The current project is built on the BNB blockchain, which is a great sign. The BNB blockchain is constantly evolving and improving based on the current state of the market. That way, the blockchain adjusts to any change that we may see in NFTs in the future.

On top of that, the team is looking to expand the project to other blockchains, which is another promising sign.

Heart of Gold is a unique approach to NFTs. Instead of using them in the same way as other projects, HoG uses its NFTs as lottery tickets. This not only ensures that every player gets to win, but it also offers a way to burn the NFTs and target hyperinflation and deflation.

HOW IS HOG DIFFERENT FROM EXISTING NFT COLLECTIONS?

Many NFT projects and collections lack utility. Usually, participants are just supposed to hold on to the NFTs and do nothing else with them until they decide to sell. HoG stands out because it gives players multiple ways to use the NFTs and potentially bring in profits.

Players can either hold on to their NFTs, give them to Deus Ex Machina, or sell them on the secondary market.

Since the NFTs are lottery tickets, there is an incentive to hold on to them until the prize pools are released. But if you're looking for a sure way to earn from the NFTs, you can also sell the NFTs on the secondary market or trade them into Deus Ex Machina, a mysterious creature in the game that needs the NFTs to survive.

This way, the game creates a more sustainable ecosystem for players and investors. So, HoG has the potential to cover some of the major problems other NFT projects face.

HOG NFT COLLECTION

Now it's time for us to look closely at the HoG NFT collections and what makes them so special in the first place.

NFT LOTTERY TICKETS

All the NFTs in the HoG collection are lottery tickets. Players can stock up on NFT tickets and hold on to them for the grand lottery. This is a bit down the line in HoG's roadmap, but there will eventually be a grand lottery with large prize pools for all players that got their hands on some of the 10,000 NFTs ready for minting.

These NFTs have unique qualities and rarity levels to them. So, rarer NFTs might offer larger prizes and be more valuable in the future.

The collection itself is very big and each ticket has a uniquely captivating design. This is one of the perks of minting one of the HoG NFTs, as you're sure to get a high-quality and high-value NFT.

When minting an NFT, holding on to them until the grand lottery isn't your only option. Players can also sell the NFTs on the secondary market. And when selling NFTs on the market, players can potentially bring in large profits, especially if they have rare NFTs.

But that isn't the only way to use the NFT lottery tickets. There's one more unique mechanic to this project, which we explain next.

LOTTERY MECHANICS

The mechanics of the lottery tickets is very simple. The collection's concept and its lottery are developed as a random blockchain generation of tokens based on the prize matrix. The HoG collection consists of 10,000 tokens, with a minimum minting target set at 5,000 tokens.

The whole process begins with the minting of the collections. Users will purchase tickets, and right after, they will discover their ticket's category. Each category has five ranks that correlate with the size of the prize.

Once the minting is officially closed, the lottery stage begins with the distribution of prizes. During the second stage, the mechanisms of the lottery start working, and participants are sorted in rankings within their respective categories. The maximum amount a participating user can profit is 100X.

The distribution of ranks will only occur under two conditions: if the collection is minted in full or at least half of the tickets are minted, and the lottery administrator stops the minting process as a whole.

If all tokens are minted (10,000 tickets), it takes a day for the system to automatically generate the ranks based on ticket traits. If the minting is halted after half of the collection is already minted, the winning coefficient will be recalculated in an equal proportion aligned with the total number of minted tickets.

Prize reward pools originate from the minting income and the funds added directly via the smart contract. Those funds cannot be withdrawn in any way other than as an assigned prize reward. Moreover, part of the minting income will go to the development team and HoG brand to ensure sustainable growth of the collection's value in the secondary market.

DEUS EX MACHINA

When the minting process ends, there will be a mysterious figure called Deus Ex Machina. Not much is known about Deus, but one thing that you can do is sell your NFTs to Deus, who will absolutely buy any HoG NFT you offer.

Why does Deus do this?

Well, we aren't exactly sure. Some say that Deus requires NFTs to sustain its life force, while others have their own theories of why you can sell all your NFTs to the entity.

Each NFT ticket has a set of attributes assigned. Deus uses these attributes to gauge the value of your cards whenever you sell them. That way, you have a way of bringing in a profit without going on the secondary market or waiting for the grand lottery.

THE HOG INFRASTRUCTURE

Another promising feature of HoG is its solid foundation. HoG has a great infrastructure which is one of the reasons why it will make huge waves in the NFT market. Here's a quick look at the current HoG infrastructure and potential plans for the future.

BNB CHAIN

The current NFT project is built on the BNB blockchain. This is very promising because the BNB chain is known to be stable and evolve based on current trends. On top of that, the BNB chain explores cross-chain and multi-chain solutions, which is why there's so much potential in building this NFT project on the BNB chain.

FUTURE BRIDGES

While the current project is built on the BNB blockchain, it won't stay that way forever. A huge part of HoG's plans includes building bridges to other chains like Solana, Ethereum, and more. That way, the project becomes more accessible and universal.

HoG plans to expand into the top blockchains available today. That way, they can reach and serve a wider market. This isn't something you see in the plans of other NFT projects and is a big reason why you might want to keep your eye on Heart of Gold.

HOG GAME MECHANICS

Unlike other NFT projects, HoG is simple and easy to understand. While the infrastructure and theory can be quite complex to understand, figuring out the mechanics of the game is incredibly simple. Here's how HoG works:

RANDOMIZED MINTING

Currently, there are 10,000 NFTs in the HoG collection available for minting. This is the first phase of the project and the part where you can get your hands on HoG lottery ticket NFTs at the best price.

Right now, players can go on the HoG website to mint tickets for 0,3 BNB. To protect yourself from phishing scams, HoG emphasises that you should only mint NFTs from the official website to avoid scammers.

There are 10,000 NFTs available for minting. And while they cost some money, all players can potentially earn up to a 100X profit from each NFT!

PRIZE DISTRIBUTION

This is the second phase of the project. When minting closes, HoG will begin distributing prizes using the lottery system. During this phase, players are divided into different ranks based on the NFTs that they minted.

Each rank corresponds to a different reward for the ticket. The maximum reward during this phase is up to 100X per ticket, which is a huge amount. This part of the process will only happen if all the NFTs are minted or at least half of the available NFTs are minted.

PRIZE REWARD POOLS

The last phase of the project involves prize reward pools. This will happen after minting and prize distributions, using funds from the minting income. These funds are automatically added on using a smart contract, which is another reason HoG is a reliable and promising project.

The rewards can't be withdrawn unless part of the assigned prize reward. The project will also get funds from the minting income to support the team and brand. That way, the project will be sustainable moving forward, upping the collection's value!
